

Introduction to Computer Science

CSCI 109

Andrew Goodney

Fall 2019

Schedule

Date	Topic		Assigned	Due	Quizzes/Midterm/Final	Slide Deck
26-Aug	Introduction	What is computing, how did computers come to be?				1
2-Sep	Labor day					
9-Sep	Computer architecture	How is a modern computer built? Basic architecture and assembly	HW1			2
16-Sep	Data structures	Why organize data? Basic structures for organizing data			Quiz 1 on material taught in class 8/26 and 9/9	3
23-Sep	Data structures	Trees, Graphs and Traversals	HW2	HW1		4
30-Sep	More Algorithms/Data Structures	Recursion and run-time				5
7-Oct	Complexity and combinatorics	How "long" does it take to run an algorithm. P vs NP			Quiz 2 on material taught in class 9/16 and 9/23	5
14-Oct	Algorithms and programming	Programming, languages and compilers		HW2	Quiz 3 on material taught in class 9/30	7
21-Oct	Operating systems	What is an OS? Why do you need one?	HW3		Quiz 4 on material taught in class 10/7	8
28-Oct	Midterm	Midterm			Midterm on all material taught so far.	
4-Nov	Computer networks	How are networks organized? How is the Internet organized?		HW3		9
11-Nov	Artificial intelligence	What is AI? Search, planning and a quick introduction to machine learning			Quiz 5 on material taught in class 9/4	10
18-Nov	The limits of computation	What can (and can't) be computed?	HW4		Quiz 6 on material taught in class 11/11	11
25-Nov	Robotics	Robotics: background and modern systems (e.g., self-driving cars)			Quiz 7 on material taught in class 11/18	12
2-Dec	Summary, recap, review	Summary, recap, review for final		HW4	Quiz 8 on material taught in class 11/25	13
13-Dec	Final exam 11 am - 1 pm in SGM 123				Final on all material covered in the semester	

Reading:
St. Amant Ch. 9

What is Intelligence?

Warm up...

- ◆ <https://www.youtube.com/watch?v=WnzlbyTZsQY>
- ◆ <https://www.youtube.com/watch?v=vphmJEpLXU0>

What is Measured by a Test/Standard

- ◆ “Intelligence is what is measured by intelligence tests.” (*E. Boring*)
- ◆ Thought processes, or behavior, indistinguishable from what a human would produce (at some level of abstraction)
 - ❖ *Turing test*

Conglomeration of Specific Capabilities

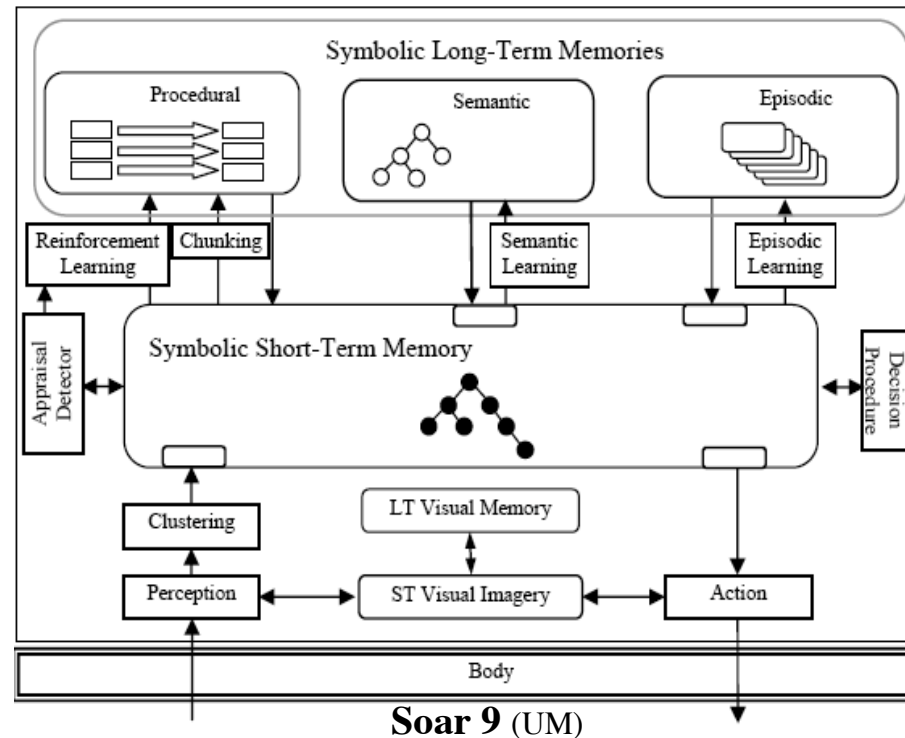

- ◆ “The general mental ability involved in calculating, reasoning, perceiving relationships and analogies, learning quickly, storing and retrieving information, using language fluently, classifying, generalizing, and adjusting to new situations” (*Columbia Encyclopedia*)
- ◆ “... a very general mental capability that, among other things, involves the ability to reason, plan, solve problems, think abstractly, comprehend complex ideas, learn quickly and learn from experience.” (*Editorial in Intelligence with 52 signatories*)

A Single Focused Capability

- ◆ “The capacity to acquire and apply knowledge.” (*The American Heritage Dictionary*)
- ◆ “The ability to plan and structure one’s behavior with an end in view.” (*J. P. Das*)
- ◆ “... the ability of an organism to solve new problems ...” (*W. V. Bingham*)
- ◆ “The capacity to learn or to profit by experience.” (*W. F. Dearborn*)
- ◆ “The ability to carry on abstract thinking.” (*L. M. Terman*)
- ◆ “... ability to achieve goals in a wide range of environments.” (*S. Legg & M. Hutter*)
- ◆ ... ability to act rationally; that is, “does the ‘right thing,’ given what it knows.” (*S. Russell & P. Norvig*)

Definition of Intelligence

- ◆ The common underlying capabilities that enable a system to be general, literate, rational, autonomous and collaborative
 - ❖ Can be combined into a **Cognitive Architecture**
 - ◆ Defined in analogy to a computer architecture
 - ◆ Provides fixed (“programmable”) structure of a *mind*

The Study of Intelligence

- ◆ **Cognitive Science** is the interdisciplinary study of mind and intelligence in both natural and artificial systems
 - ❖ Although many limit it to just natural systems
- ◆ Disciplines involved include
 - ❖ **Philosophy**: Questions, concepts and formalisms
 - ❖ **Psychology**: Data and theories about natural systems
 - ❖ **Linguistics**: Study of language structure and use
 - ❖ **Neuroscience**: Data/theory that ground mind in brain
 - ❖ **Anthropology**: Intelligence in/across context/culture
 - ❖ **Sociology**: Data/theory on natural societies
 - ❖ **Computer science**: Study and construction of artificial systems, plus methods for modeling natural systems

What is Artificial Intelligence (AI)?

- ◆ Some bad (or perverse) definitions
 - ❖ “The study of how to make computers do things at which, at the moment, people are better.” (*E. Rich & K. Knight*)
 - ❖ “The concept of making computers do tasks once considered to require thinking.” (*Medford Police*)
 - ❖ “An algorithm by which the computer gives the illusion of thinking like a human.” (*D. Gruber*)
 - ❖ “Making computers behave like humans.” (*Webopedia*)

A Better Definition

- ◆ “The scientific understanding of the **mechanisms** underlying thought and intelligent behavior and their embodiment in machines.” (AAAI)
- ◆ Overlaps strongly with Cognitive Science and its various subdisciplines, but also relates to:
 - ❖ **Mathematics**: Formalizations and analyses
 - ❖ **Economics**: Decision making
 - ❖ **Operations research**: Optimization and search
 - ❖ **Engineering**: Robotics
- ◆ The “what” is too hard, let’s study the “how”

Systems of Interest

- ◆ Have goals to achieve
 - ❖ May concern internal or external situations
 - ❖ May be endogenous or exogenous
- ◆ Have capabilities to perceive and act in service of their goals
 - ❖ For external environments, might include eyes, ears, hands, legs, etc.
 - ❖ Or wheels, laser range finders, etc.
- ◆ Can embody “knowledge” concerning their goals, capabilities, and situations

Knowledge

Goals

Agents

- ◆ Such systems are generally called **Agents** (or **Intelligent Agents**) within AI
 - ❖ Differs from notion of agent in Hollywood and in the rest of CS, where the focus is on proxies (or representatives)
- ◆ May be embodied as *virtual humans & intelligent robots*
- ◆ Provides an integrative focus for AI
 - ❖ Although most of AI focuses on individual aspects
 - ◆ Search and problem solving, knowledge representation and reasoning, planning, machine learning, natural language and speech, vision and robotics, ...

Willow Garage PR2

USC/ICT Ada & Grace

Some Relevant Agent Aspects

- ◆ **Generality:** Scope of goals and capabilities usable for them
 - ❖ Can the agent play both chess and tennis?
 - ❖ Can it solve math problems and drive a car?
 - ❖ Can it successfully perform full scope of adult human tasks?
- ◆ **Literacy:** Extent of knowledge available
 - ❖ Ignorance by itself is not lack of intelligence
- ◆ **Rationality:** Making best decisions about what to do given goals, knowledge and capabilities
 - ❖ Thermostats may be perfectly rational, but with limited generality
- ◆ **Autonomy:** Operating without assistance
- ◆ **Collaboration:** Working well with others

Some Examples

Deep Blue (IBM)

In 1997 Deep Blue became the first machine to win a match against a reigning world chess champion (by 3.5-2.5)

May 11th, 1997

Computer won world champion of chess
 (Deep Blue) (Garry Kasparov)

(Reuters = Kyodo News)

Game viewer - Kasparov vs. Deep Blue

File Help

GAME 6 IBM

MATCH SCORE	
3.5	2.5
Deep Blue	Kasparov
00:08:25	00:08:20

	white	black
0	Prelude	
1	e4	c6
2	d4	d5
3	Nc3	dxe4
4	Nxe4	Nd7
5	Ng5	Ngf6
6	Bd3	e6
7	N1f3	h6
8	Nxe6	Qe7
9	O-O	fxe6

MAURICE ASHLEY: After Ngf6 Deep Blue has responded instantly with Bf1-d3, developing the bishop, putting it on a very solid square. Potentially Kasparov might castle king-side, so the

Some Chess Details

- ◆ 20 possible start moves, 20 “replies”
- ◆ 400 possible positions after 2 ply (1 B and 1 W)
- ◆ 197281 positions after 4 ply (2 B and 2 W)
- ◆ 7^{13} positions after 10 moves
- ◆ Approximately 40 legal moves in any position
- ◆ Total of about 10^{120} number of possible chess games

Search Trees

- ◆ Nodes are positions, edges are legal moves
- ◆ Leaf nodes are end positions that need to be evaluated
- ◆ Leaf nodes that end in check mate for the opponent are good
- ◆ Leaf nodes that don't end in check mate need to be evaluated in some other way
- ◆ Each node gets a numeric evaluation score

Minimax: Basic search

- ◆ Computer assumes that both W and B play the 'best' move.
- ◆ Computer plays W and maximizes the score for W
- ◆ Choose child node with highest value if W to move
- ◆ Choose child node with lowest value if B to move
- ◆ About 40 branches at each position in a typical game
- ◆ If you want to look d ply ahead you need to search $O(b^d)$
- ◆ Heuristics

Tree Traversal

- ◆ Depth first traversal

- ❖ Eric, Emily, Terry, Bob, Drew, Pam, Kim, Jane

- ◆ Breadth first traversal

- ❖ Eric, Emily, Jane, Terry, Bob, Drew, Pam, Kim

- ◆ Best first traversal?

- ❖ Follow edges to your best friend.

Best First Search

OPEN = [initial state] (game states are the nodes of the graph)

CLOSED = []

while OPEN is not empty do

1. Remove the best node from OPEN, call it n , add it to CLOSED.
2. If: n is the goal state, backtrack path to n (through recorded parents) and return path.
3. Else: Create n 's successors.
4. For each successor do:
 - a. If it is not in CLOSED and it is not in OPEN: **evaluate it**, add it to OPEN, and record its parent.
 - b. Otherwise, if this new path is better than previous one, change its recorded parent.
 - i. If it is not in OPEN add it to OPEN.
 - ii. Otherwise, adjust its priority in OPEN using this new evaluation.

Greedy Best First Search

- ◆ What does it mean “best”?
- ◆ Evaluation function is a heuristic that attempts to predict how close the end of a path is to a solution
- ◆ Paths which are judged to be closer to a solution are extended first.
- ◆ This specific type of search is called greedy best-first search.

A* search: Best-first with $f = g + h$

For every node the evaluation is a knowledge-plus-heuristic cost function $f(x)$ to determine the order in which the search visits nodes.

The cost function is a sum of two functions:

- ❖ past path-cost function, which is the known distance from the starting node to the current node x (usually denoted $g(x)$)
- ❖ future path-cost function, which is an admissible "heuristic estimate" of the distance from x to the goal (usually denoted $h(x)$).

Admissible means that h must not overestimate the distance to the goal.

Deep Blue Combined

- ◆ Parallel and special purpose hardware

- ❖ A 30-node IBM RS/6000, enhanced with
- ❖ 480 special purpose VLSI chess chips

- ◆ A heuristic game-tree search algorithm

- ❖ Capable of searching 200M positions/sec (out of 10^{43} total)
- ❖ Searched 6-12 moves deep on average, sometimes to 40

- ◆ Chess knowledge

- ❖ An opening book of 4K positions
- ❖ An endgame database for when only 5-6 pieces left
- ❖ A database of 700K GM games
- ❖ An evaluation function with 8K parts and many parameters that were tuned by learning over thousands of Master games

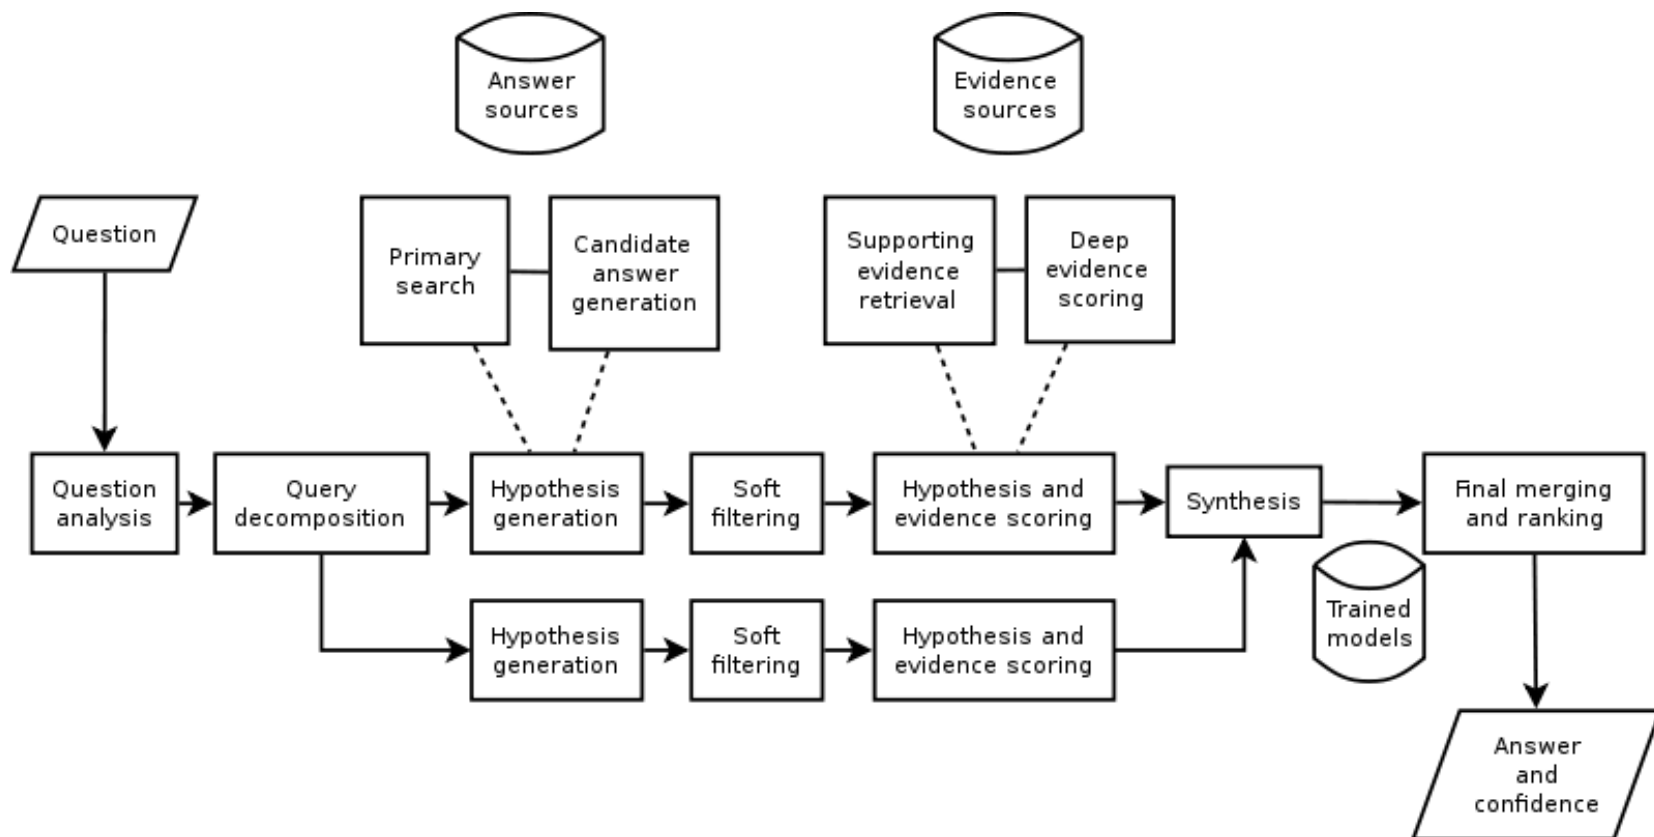

Watson (IBM)

- ◆ Compete (and win!) on Jeopardy
 - ❖ Question answering (or answer questioning)
- ◆ Parallel hardware
 - ❖ 2880 IBM POWER7 processor cores with 16 Terabytes of RAM
- ◆ Natural language understanding and generation
- ◆ A large knowledge base derived via machine learning from 200 million pages

Watson (IBM)

◆ Search via *generate and test*

Google DeepMind AlphaGo

- ◆ AlphaGo combines advanced tree search with two deep neural networks
- ◆ Advanced tree search is a Monte-Carlo search
- ◆ Deep neural networks
 - ❖ take a description of the Go board as an input and process it through 12 different network layers containing millions of neuron-like connections
 - ❖ “policy network,” selects the next move to play
 - ❖ “value network,” predicts the winner of the game

Neural Network Training

- ◆ Neural network trained on 30 million moves from games played by human experts, until it could predict the human move 57 percent of the time
- ◆ AlphaGo “learned” to discover new strategies, by playing thousands of games between its neural networks, and adjusting the connections in the networks using a trial-and-error process known as reinforcement learning.
- ◆ LOTS of computing power -> extensive use of Google Cloud Platform.

Beating the world's top player

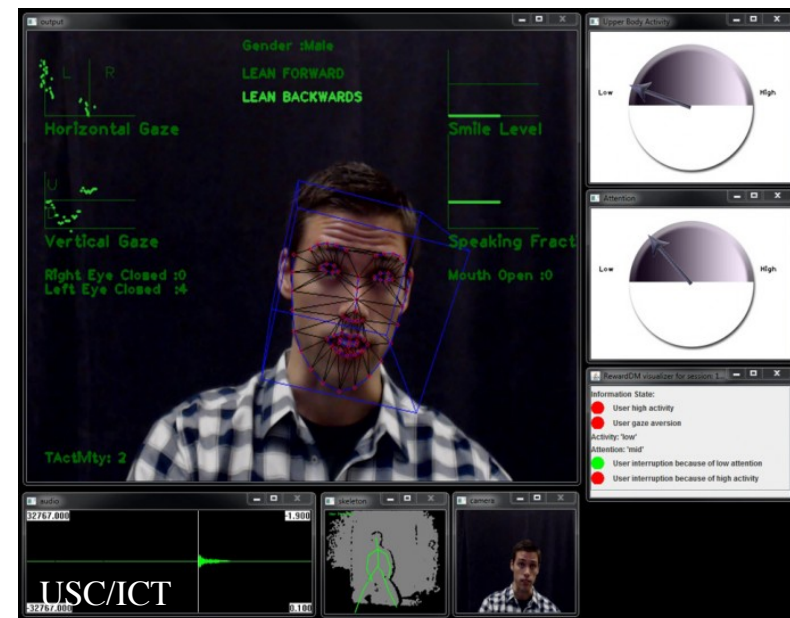

- ◆ In March 2016 AlphaGo took on Lee Sedol, the world's top Go player, in the Google DeepMind challenge
- ◆ Final score: AlphaGo 4 - Lee Sedol 1
- ◆ Human: great game play without extensive training
- ◆ Machine: better than human game play with orders of magnitude more training and essentially infinite recall

Virtual Humans (USC/ICT)

Virtual Humans Combine

- ◆ Graphical human bodies with movement and gesture
- ◆ Speech, natural language and dialogue
 - ❖ May also have ability to visually sense state of human
- ◆ Models of actions that can be performed
 - ❖ Knowledge about how to choose among them
 - ❖ Plans comprising sequences of them
- ◆ Emotion models

The Big Three Topics within AI

◆ Deciding what to do next

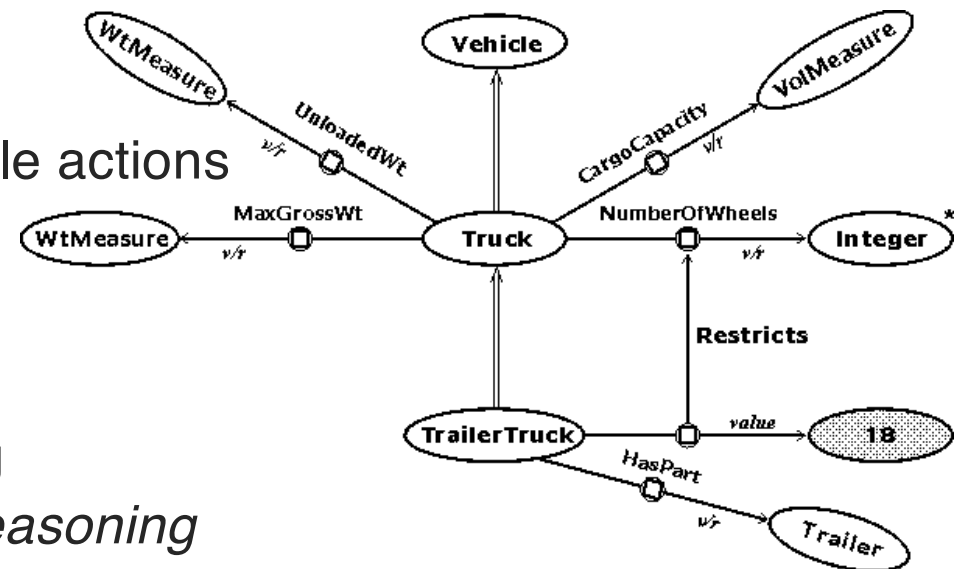

- ❖ Search over possibilities to see which succeed (or are best)
 - ◆ A major focus in Deep Blue
 - ◆ *Book describes several basic search algorithms*
- ❖ Create and execute plans
 - ◆ Used extensively in virtual humans
- ❖ Integrate knowledge about available actions
 - ◆ Watson has a major focus on this

◆ Reasoning about situations

- ❖ Knowledge representation
- ❖ Logical and probabilistic reasoning
- ❖ *Book describes basics of logical reasoning*

◆ Learning from experience and interactions with others

- ❖ Watson and AlphaGo have a major focus on learning
- ❖ *Book describes one basic algorithm*

Others

- ◆ Communication

- ❖ Verbal: Speech and natural language
- ❖ Nonverbal: Gesture, expression, ...

- ◆ Perception

- ❖ Audition, vision, ...

- ◆ Action (Robotics)

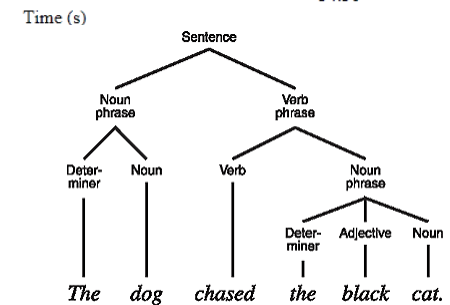

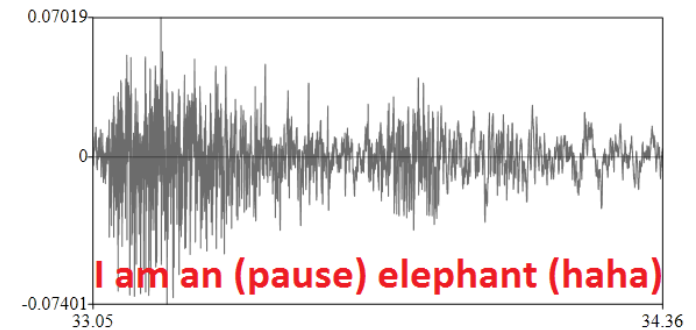

- ❖ Movement/mobility, manipulation (arms and hands)

- ◆ Social

- ❖ Cooperative, competitive, ...
- ❖ Affect

- ◆ Integration (Architectures)

- ◆ Applications

AI vs. Machine Learning

- ◆ BOTH extremely hot topics in CS
 - ❖ Want to “make a difference” and \$200k/yr doing so?
- ◆ Often used interchangeably by press, non-Computer Scientists
- ◆ Tl;dr
 - ❖ AI = Actions
 - ❖ Machine Learning = Data
- ◆ AI is about actions: an intelligent system (agent) choosing what to do in a “smart” way
- ◆ Machine learning is about data: automatically analyzing large amounts of data to discover patterns so predictions can be made when presented with new data
- ◆ Many AI systems use algorithms trained with machine learning to inform their decisions

Philosophical Issues

◆ Is AI Possible?

- ❖ Only act as if intelligent (Weak AI)
- ❖ Can actually be intelligent [Think] (Strong AI)

◆ What are the moral issues in AI?

- ❖ With respect to humans
- ❖ With respect to machines
- ❖ Beyond humans and machines

Borg (Paramount)
