What is Computer Science

- All science is computer science
 - It is very interdisciplinary: Math, Engineering, Medicine, Natural sciences, Art, Linguistics, Social Sciences etc.
- It is more about problem-solving and developing algorithms to solve information-based problems
 - How do I recognize objects in a photograph
 - What patterns can be found in a set of data that would allow me to predict future outcomes
 - Identify the function of this protein given its structure
- Computer science is no more about computers than astronomy is about telescopes*
 - Computers are the primary tool

*This is a famous quote. However, who said it first is unclear.

What Computer Scientist Do...

- Find methods to solve information-based problems (algorithms) **[this is truly CS]**
 - Observe, organize, transform and discover useful information from data
 - Use math and logic to solve problems
 - Work in (cross-discipline) groups
- Convert these methods/algorithms to a form that a computer can execute **[this is programming]**
- **We generally do both**

Computer Science Is...

- A great way to make a living
 - *Maria Klawe, et. al. - To the age-old question -- "What do you want to do when you grow up?" -- children today give many modern answers: "Help feed hungry families." "Prevent and cure diseases." "Find sources of renewable energy." "Understand the universe." One clear path leads to each of these aspirations: the study of computer science (& engineering).*
- But not without challenges...
 - <https://www.newsweek.com/computer-science-popular-college-major-has-one-highest-unemployment-rates-2076514>
 - <https://www.signalfire.com/blog/signalfire-state-of-talent-report-2025>
 - <https://sfstandard.com/2025/05/20/silicon-valley-white-collar-recession-entry-level/>

CS 103 or CS 102

- CS103: **Introduction** to **Programming**
- **Introduction** but requires some prior programming experience
 - Must have passed AP CS exam and or the CS 102 placement exam
 - Should know one of Java, Python, or C/C++
 - Those that meet the above criteria, but don't feel confident may consider CS 102 as a slower-paced on ramp to programming
- **Programming**
 - We'll try to teach good coding practices and how to find efficient solutions (not just any solution)
 - We'll focus on concepts present in most languages using C/C++ as the primary language (not Java nor Python)

<http://climbingla.blogspot.com/2010/05/walk-6-hermon-and-highland-park.html>

http://epshardot.org/index.php?title=234.2_Diamond_Interchanges

Course Structure

- The course is broken into 6 units each consisting of:

**C++ Language
Syntax**

Pointers and Memory

Objects 1

Managing Data

Objects 2

Recursion

Exams and Grading

- The course will utilize 4 exams during class
 - Each exam is tied to a project
- And the final during finals week

EXAMS

Exam	Time	Location	Info
Ex1	Thursday, September 24th	(in class)	Info
Ex2	Thursday, October 16th	(in class)	Info
Ex3	Thursday, November 19th	(in class)	Info
Ex4	Thursday, December 3rd	(in class)	Info
Final	Saturday, December 12 11am - 1pm	TBA	Info

Syllabus

- Let's look at the syllabus and course website

Expectations

- Attend lectures & be engaged
 - Ask questions
 - We're a team...I need you!
 - I'll give you my best. Try to give me yours!
- Catch the wave!
 - Start assignments early, complete them early
 - Study and review after each lecture
- Go deep!
 - Read more on your own or ask questions
 - Don't be satisfied with partial understanding
 - Build the mental muscles needed to solve errors and bugs on your own

Programming Languages

- Imperative/Structured Languages
 - Describe the what (data) and how (instructions/algorithm)
 - Examples: C/C++, Java, Javascript, Python
 - The focus of most programming courses
 - Programs are like a recipe for how to operate on data

```
1 import math
2
3 a = int(input("Enter a: "))
4 b = int(input("Enter b: "))
5 c = int(input("Enter c: "))
6
7 det = b*b - 4*a*c
8 if(det >= 0):
9     r1 = (-b - math.sqrt(det)) / (2*a)
10    r2 = (-b + math.sqrt(det)) / (2*a)
11    print(f'Roots are {r1} and {r2}')
12 else:
13    print("Imaginary roots")
```

Quadratic Equation Solver

Instructions

Data

Computer
(Reads instructions,
operates on data)

Why C/C++

- We will teach C++ in this course because...
 - C/C++ is *still* a very popular language in industry
 - C/C++ is ubiquitous
 - Used everywhere, even to implement other programming languages (i.e. Python, Matlab, etc.)
 - C/C++ is close to the actual hardware
 - Makes it fast & flexible (Near direct control of the HW=Hardware)
 - Makes it dangerous (Near direct control of the HW)
 - Most common in embedded devices (your phone, car, wireless router, etc.)
 - Principles and concepts of C/C++ will allow you to quickly learn other programming languages
 - C/C++ is extremely broad and allows you to learn other languages easily
 - Not Java

High Level Languages

Mother Tongues

Tracing the roots of computer languages through the ages

Just like half of the world's spoken tongues, most of the 2,300-plus computer programming languages are either endangered or extinct. As powerhouses C/C++, Visual Basic, Cobol, Java and other modern source codes dominate our systems, hundreds of older languages are running out of life.

An ad hoc collection of engineers-electronic lexicographers, if you will-aim to save, or at least document the lingo of classic software. They're combing the globe's 9 million developers in search of coders still fluent in these nearly forgotten lingua frangas. Among the most endangered are Ada, APL, B (the predecessor of C), Lsp, Oberon, Smalltalk, and Simula.

Code-raker Grady Booch, Rational Software's chief scientist, is working with the Computer History Museum in Silicon Valley to record and, in some cases, maintain languages by writing new compilers so our ever-changing hardware can grok the code. Why bother? "They tell us about the state of software practice, the minds of their inventors, and the technical, social, and economic forces that shaped history at the time," Booch explains. "They'll provide the raw material for software archaeologists, historians, and developers to learn what worked, what was brilliant, and what was an utter failure." Here's a peek at the strongest branches of programming's family tree. For a nearly exhaustive rundown, check out the Language List at [HTTP://www.informatik.uni-freiburg.de/Java/misc/lang_list.html](http://www.informatik.uni-freiburg.de/Java/misc/lang_list.html). - Michael Mendeno

Key

- 1954 Year Introduced
- Active: thousands of users
- Protected: taught at universities; compilers available
- Endangered: usage dropping off
- Extinct: no known active users or up-to-date compilers
- Lineage continues

Sources: Paul Boutin; Brent Hailpern, associate director of computer science at IBM Research; The Retrocomputing Museum; Todd Proebsting, senior researcher at Microsoft; Gio Wiederhold, computer scientist, Stanford University

History of C and C++

Language	Originator	Year
Algol	International Group	1960
Basic Combined Programming Language (BCPL)	Martin Richards	1967
B	Ken Thompson	1970
C	Dennis Ritchie	1972
K&R C	Brian Kernighan & Dennis Ritchie	1978
C++	Bjarne Stroustrup	1980
C++-98 and 03	ISO/IEC 14882:1998/2003	1998, 2003
C++-11,14,17,20	ISO/IEC 14882:2011	2011 and onward

<https://www.scaler.com/topics/cpp/origin-and-philosophy-of-cpp/>

Philosophy of C++

- Compatibility
 - The language should be compatible with C.
 - The transition from C to C++ should not be difficult. *(yeah right!)*
- Choice (and Efficiency)
 - The language should give the option to programmers to make their own choice, even if it increases the possibility that a programmer will choose incorrectly.
 - The language should not slow down a program or consume space (overhead) for the features not used in the code.
- **Summary: Minimalist**
 - C and C++ force nothing extra upon you (even protections)
 - If you want "extra", implement it yourself or use a library

The Design and Evolution of C++, Bjarne Stroustrup

Quotes from Bjarne

- *"There are only two kinds of languages: the ones people complain about and the ones nobody uses".*
- *"C++ is designed to allow you to express ideas, but if you don't have ideas or don't have any clue about how to express them, C++ doesn't offer much help."*

- Bjarne Stroustrup ([Quotes](#))

Fact 1: Everything is a number

FACT 1 AND FACT 2

It's A Numbers Game

- **Fact 1:** Everything in a computer is a **number**
 - Sure. Things like 103 and 3.9 are numbers
 - But what about text and images and sound?
 - Everything!
- **Fact 2:** Computer operations can only work with or "see" **1 or 2 numbers at a time** (i.e. they can only do 1 thing at a time)
- Humans process information differently
 - Therein lies some of the difficulty of learning programming

```
1 import math
2
3 a = int(input("Enter a: "))
4 b = int(input("Enter b: "))
5 c = int(input("Enter c: "))
6
7 det = b*b - 4*a*c
8 if(det >= 0):
9     r1 = (-b - math.sqrt(det)) / (2*a)
10    r2 = (-b + math.sqrt(det)) / (2*a)
11    print(f'Roots are {r1} and {r2}')
12 else:
13    print("Imaginary roots")
```

Example (1)

- What do you see?
 - The letter 'a'!

a

- What does the computer see?
 - A number; each text character is coded to a number
 - Example: Character map / Insert symbol

97

Text Representation

- Most common character code is ASCII (UTF-8)
- Every character, even non-printing, characters have a corresponding numbers
 - Decimal (base 10) / Hexadecimal (base 16)

Dec	Hex	Name	Char	Ctrl-char	Dec	Hex	Char	Dec	Hex	Char	Dec	Hex	Char
0	0	Null	NUL	CTRL-@	32	20	Space	64	40	@	96	60	`

<https://www.commfront.com/pages/ascii-chart>

Example 2

- What do you see?
 - A face!
- What does the computer see?
 - Individual pixels whose value indicates the shade of gray (or color)

Individual
Pixels

0	0	0	0
64	64	64	0
128	192	192	0
192	192	128	64

The Connection with Mathematics

- Brightness
 - Each pixel value is increased/decreased by a constant amount
 - $P_{\text{new}} = P_{\text{old}} + B$
 - $B > 0$ = brighter
 - $B < 0$ = less bright
- Contrast
 - Each pixel value is multiplied by a constant amount
 - $P_{\text{new}} = C * P_{\text{old}} + k$
 - $C > 1$ = more contrast
 - $0 < C < 1$ = less contrast
- Same operations performed on all pixels

But Why?

- Why can't computer just "look" at the image
 - Computers store information as numbers (e.g. each pixel of an image is a separate number)
 - These numbers are stored as units of 8-, 32- or 64-bits in the computer's RAM (memory)
 - The computer processor must retrieve them from memory 1 at a time

Individual Pixels

0	0	0	0
64	64	64	0
128	192	192	0
192	192	128	64

Image taken from the photo "Robin Jeffers at Ton House" (1927) by Edward Weston

Processor

Can only transfer 1 value at a time

**RAM
(memory)**

Memory

- Set of cells that each store a group of bits (usually, 1 byte = 8 bits)
- Unique address assigned to each cell
 - Used to reference the value in that location

Address	Data
0	11010010
1	01001011
2	10010000
3	11110100
4	01101000
5	11010001
	...
1023	00001011

**Memory
Device**

Memory Operations

- Processor can access 1 location at a time, either reading or writing that location
 - Read**: retrieves data value in a particular location (specified using the address)
 - Write**: changes data in a location to a new value
- High level operation: $x = x + 1$
 - Read x 's current value from memory to the processor
 - Add 1
 - Write x 's new value back to memory

A Read Operation

A Write Operation

How many steps does it take a computer to perform the following tasks

1 OR MANY

One Operation or Many (1)

```
#include <iostream>
#include <string>
using namespace std;

// Execution starts at main()
int main()
{
    int x = 1, y = 2;

    x = y;

    return 0;
}
```

One / Many

```
#include <iostream>
#include <string>
using namespace std;

// Execution starts at main()
int main()
{
    string x = "abc", y = "defg";

    x = y;

    return 0;
}
```

One / Many

One Operation or Many (1)

```
#include <iostream>
#include <string>
using namespace std;

// Execution starts at main()
int main()
{
    int x = 1, y = 2;

    x = y;

    return 0;
}
```

One

```
#include <iostream>
#include <string>
using namespace std;

// Execution starts at main()
int main()
{
    string x = "abc", y = "defg";

    x = y;

    return 0;
}
```

Many

ints are single objects to a computer
strings are composite objects (i.e. an array) to a computer

Strings Overview

- **strings** simply abstract character arrays
- Behind the scenes strings are just creating and manipulating character arrays but giving you a simplified set of operators and functions
- When the contents of the string grow too large, a new array is allocated behind the scenes (potentially copying the contents of the old string)

```
#include <iostream>
#include <string>
using namespace std;

int main()
{
    string str2 = "abc";
    // str2 stores 3 chars. = "abc"

    str2 = "defgh";
    // now str2 stores 5 characters

}
```

One Operation or Many (2)

```
#include <iostream>
#include <string>
using namespace std;

int main()
{
    char c = 'a', d = 'b';

    if(c == d) {
        ...
    }
    return 0;
}
```

One / Many

```
#include <iostream>
#include <string>
using namespace std;

int main()
{
    string x = "abc", y = "acb";

    if(x == y) {
        ...
    }
    return 0;
}
```

One / Many

One Operation or Many (2)

```
#include <iostream>
#include <string>
using namespace std;

int main()
{
    char c = 'a', d = 'b';

    if(c == d) {
        ...
    }
    return 0;
}
```

One

```
#include <iostream>
#include <string>
using namespace std;

int main()
{
    string x = "abc", y = "acb";

    if(x == y) {
        ...
    }
    return 0;
}
```

Many

chars, doubles, ints can be compared in a single operation
strings are arrays and must be compared character by character

One Operation or Many (3)

```
#include <iostream>
#include <string>
using namespace std;

int main()
{
    // Mimics an integer array
    vector<int> y = {1,2,3};

    y.push_back(4); // append 1 int

    return 0;
}
```

One / Many

One Operation or Many (3)

```
#include <iostream>
#include <string>
using namespace std;

int main()
{
    // Mimics an integer array
    vector<int> y = {1,2,3};

    y.push_back(4); // append 1 int

    return 0;
}
```

Many

Growing an array (which is the underlying structure of a vector) may require reallocating a larger array and copying the old contents

What Happens Behind the Scenes

- Vectors abstract arrays
 - Behind the scenes vectors are just creating and manipulating arrays but giving you a simplified set of operators and functions

```
#include <iostream>
#include <vector>
using namespace std;
int main()
{
    vector<int> v1(5);
    for(int i=0; i < 5; i++){
        v1[i] = i+50;
    }
    v1.push_back(10);
    // causes a resize behind the scenes
}
```

Andrew Goodney, Ph.D.

- Senior Lecturer in Computer Science
- Grew up in Salem, Oregon
- BS/MS Electrical Engineering 2000, 2008 USC, PhD CS 2014
- Professional career: film/television industry (mostly)
- USC faculty since 2016
- Research
 - Broadly computer networks
 - PhD research was on underwater communications
 - IoT and energy harvesting
 - Lately working on CS education projects
- Teaching
 - CSCI 103L, CSCI 104L, CSCI 114, CSCI 356
- Outside of USC
 - Swim/baseball Dad

Fact 2: A computer operation can only process 1 or 2 values at a time

THINK LIKE A COMPUTER

Path Planning

- Find shortest path from S to F

Path Planning

- Find shortest path from S to F

Path Planning

- Let's say you are a maps application and must find the appropriate path
- Fact 2** (from earlier): A computer usually can only **process** (or "see") **one or two** data items (a square) at a time

May just compute a straight line path from 'S' to 'F'

Path Planning

Path Planning

Path Planning

- What if I don't know where the Finish square is? You can examine any square in any order (no longer a robot) one at a time.
- In what order would you examine the locations to find the shortest path to the goal location?

Path Planning

- Examine all closer squares one at a time before progressing to further squares.

If you don't know where F is and want to find the shortest path, you should examine all closer locations before examining further-away locations.

Uninformed search for shortest path:

Breadth-first

A quick high-level view before we dive into the details...

OVERVIEW OF C++ PROGRAM STRUCTURE AND COMPILATION

Coming From Other Languages

Java

```
import java.lang.Math.*;

class Hello {
    public static void printName(String name) {
        System.out.println(name + " Trojan");
    }

    // Execution starts here
    public static void main(String[] args)
    {
        System.out.println("Hello: ");
        printName("Tommy");
        printName("Tina");
        double e_x = Math.exp(1.0);
        System.out.println("e is " + e_x);
    }
}
```

Python

```
import math

def printName(name):
    print(name, "Trojan")

def main():
    print("Hello: ")
    printName("Tommy")
    printName("Tina")
    e_x = math.exp(1.0)
    print("e is", e_x)

# Execution starts here (weird)
if __name__ == "main":
    main()
```

C++

```
#include <iostream>
#include <cmath>
using namespace std;

void printName(string name)
{
    cout << name << " Trojan" << endl;
}

// Execution starts at main()
int main()
{
    cout << "Hello: " << endl;
    printName("Tommy");
    printName("Tina");
    double e_x = exp(1.0);
    cout << "e is " << e_x << endl;
    return 0;
}
```

```
$ javac Hello.java
$ java Hello
Hello:
Tommy Trojan
Tina Trojan
e is 2.71828
```

```
$ python3 hello.py
Hello:
Tommy Trojan
Tina Trojan
e is 2.71828
```

```
$ g++ hello.cpp -o hello
$ ./hello
Hello:
Tommy Trojan
Tina Trojan
e is 2.71828
```

Compilation & Execution Process

C/C++ Program Format/Structure

- Comments
 - C-Style => `/*` and `*/`
 - C++ Style => `/**`
- Compiler Directives
 - `#includes` tell compiler what other library functions you plan on using
 - `'using namespace std;'` -- Just do it for now!
- `main()` function
 - Starting point of execution for the program
 - **All code/statements in C/C++ must be inside a function**
 - Statements execute sequentially (one line after the next) and **end with a semicolon (;)**
 - Ends with a `'return 0;'` statement
- Other functions
 - Functions (and later, classes) are the primary unit of code organization (and problem decomposition/abstraction)
 - Enclosed by `{` and `}` (aka curly braces)

```
/* Anything between slash-star and
star-slash is ignored even across
multiple lines of text or code */

// Anything after /** is ignored on a single line

// #includes allow access to library functions
#include <iostream> // cout and endl
#include <cmath>     // exp
using namespace std;

void printName(string name)
{
    cout << name << " Trojan" << endl;
}

// Execution always starts at the main() function
int main()
{
    cout << "Hello: " << endl;
    printName("Tommy");
    printName("Tina");
    double e_x = exp(1.0);
    cout << "e is " << e_x << endl;
    return 0;
}
```

```
$ g++ hello.cpp -o hello # compile
$ ./hello                # execute
Hello:
Tommy Trojan
Tina Trojan
e is 2.71828
```

BACKUP

Path Planning

- You can't see obstacles until you are directly neighboring them.
- Now I tell you where the finish, F, location is. Can that help you reduce the number of squares explored?

Select a square to explore with minimum distance to the finish

Path Planning

- You can't see obstacles until you are directly neighboring them.
- Now I tell you where the finish, F, location is. Can that help you reduce the number of squares explored?

Select a square to explore with minimum distance to the finish

Path Planning

- But what if we run into a blockage?
 - Now we would pick the best among the remaining, unchosen locations.

Select a square to explore with minimum distance to the finish

Path Planning

- But what if we run into a blockage?
 - Now we would pick the best among the remainder.

Select a square to explore with minimum distance to the finish

Programming vs. Algorithms

- Programming entails converting an algorithm into a specific process that a computer can execute

Another Example: Image Compression

- Images are just 2-D arrays (matrices) of numbers
- Each number corresponds to the color or a pixel in that location
- Image store those numbers in some way

Example 2 and 3

$(x,y)=(56,103)$
 $(x,y)=(57,102)$
 $(x,y)=(59,101)$
 $(x,y)=(60,100)$

- What does the computer see?
 - Coordinate pairs of each "pixel"
 - ...Or...
 - $r = 120$; origin = $(10, 14)$
 - Computer has to enumerate and visit each location and color it black

Individual Pixels

0	0	0	0
64	64	64	0
128	192	192	0
192	192	128	64

Image Compression

129	131	130	133	132	132	130	129	128	130	131	129
130	130	131	129	131	132	131	133	130	129	129	131
132	131	130	132								
134	132	131	132								
133	131										
156	157										
153	155										
154	152										
207	204										
208	205										

Image Compression

129	131	130	133	132	132	130	129	128	130	131	129
130	130	131	129	131	132	131	133	130	129	129	131
132	131	130	132								
134	132	131	132								
133	131										
156	157										
153	155										
154	152										
207	204										
208	205										

1. Break Image into small blocks of pixels

129	131	130	133
130	130	131	129
132	131	130	132
134	132	131	132

129	2	1	4
2	1	2	0
3	2	1	3
5	3	2	3

129	2	1	4
2	1	2	0
3	2	1	3
5	3	2	3

129	2	0	4
2	0	2	0
2	2	0	2
4	2	2	2

2. Store the difference of each pixel and the upper left (or some other representative pixel)

3. We can save more space by rounding numbers to a smaller set of options (i.e. only even # differences)

Video Compression

- Video is a sequence of still frames
 - 24-30 frames per second (fps)
- How much difference is expected between frames?
- Idea:
 - Store 1 of every K frames, with other $K-1$ frames being differences from frame 1 or from previous frame
